I	Representations	15
1	Cartesian representations	17
1.1	Points in \mathbb{E}^2	17
1.2	Lines in \mathbb{E}^2	18
1.3	Points, planes and lines in \mathbb{E}^3	19
1.4	Basic geometric operations	21
1.4.1	The line that intersects two points in \mathbb{E}^2	21
1.4.2	The point of intersection between two lines in \mathbb{E}^2	22
1.4.3	Distance between a point and a line in \mathbb{E}^2	23
1.5	Concluding remarks	23
2	Homogeneous representations in 2D	25
2.1	Homogeneous coordinates of 2D points	25
2.1.1	P-normalization	26
2.2	Dual homogeneous coordinates of 2D lines	27
2.2.1	D-normalization	28
2.3	Relations between points and lines	29
2.3.1	The line that intersects two points	29
2.3.2	The point of intersection between two lines	29
2.3.3	Points on a line, or not	30
2.3.4	Lines through a point, or not	30
2.4	Distances	31
2.4.1	Distance between two points	31
2.4.2	Signed distance between a point and a line	31
2.4.3	Algebraic distance between a point and a line	32
2.4.4	Concluding remark	33
2.5	Points and lines at infinity	33
2.5.1	Points at infinity	33
2.5.2	The line at infinity	34
2.6	Parametric representations of lines	35
2.7	Plücker coordinates	36
2.8	The duality principle in \mathbb{E}^2	37
3	Transformations in 2D	39
3.1	Degrees of freedom	39
3.2	Rigid transformations	40
3.3	Similarity transformations	43
3.4	Affine transformations	45
3.4.1	Non-uniform scaling	45
3.4.2	Reflection	46
3.4.3	Shearing	47
3.4.4	Decomposition of an affine transformation	48
3.5	Dual transformations	48

3.5.1	Dual affine transformations	49
3.6	Projections	50
3.7	Concluding remarks	50
4	Homogeneous representations in 3D	53
4.1	Homogeneous coordinates of 3D points	53
4.1.1	P-normalization	54
4.1.2	Points at infinity	54
4.2	Dual homogeneous coordinates of 3D planes	54
4.2.1	D-normalization	55
4.2.2	The plane at infinity	55
4.2.3	Parametric representation of a plane	55
4.3	Homogeneous representations of 3D lines	56
4.3.1	Parametric representation of a 3D line	56
4.3.2	Plücker coordinates of 3D lines	56
4.3.3	Lines at infinity	56
4.3.4	L-normalization	57
4.3.5	Dual Plücker coordinates	57
4.3.6	The duality mapping	58
4.3.7	Internal constraint and degrees of freedom	58
4.3.8	DL-normalization	59
4.4	Incidence relations between points, planes, and lines	60
4.4.1	The intersection of a line with a plane	60
4.4.2	The plane that intersects a line and a point	60
4.4.3	The point that intersects three planes	61
4.4.4	The plane that intersects three points	61
4.4.5	Points on a plane, or not	61
4.4.6	Planes through a point, or not	62
4.4.7	The intersection of two lines	62
4.5	Distances	63
4.5.1	Distance between two points	63
4.5.2	Signed distance between a point and a plane	63
4.5.3	Distance between a point and a line	64
4.6	The duality principle in \mathbb{E}^3	64
5	Transformations in 3D	65
5.1	Degrees of freedom	65
5.2	Rigid transformations	65
5.3	Similarity transformations	66
5.4	Affine transformations	66
5.5	Dual transformations	67
5.6	Line transformations	68
6	Homographies	69
6.1	Homographies in 2D	69
6.1.1	Applications of homographies	71
6.1.2	Points at infinity revisited	71
6.2	Homographies in 3D	72
6.3	Canonical homogeneous coordinates	72
6.3.1	Canonical homogeneous coordinates in 2D	73
6.3.2	Canonical homogeneous coordinates in 3D	73
6.3.3	Concluding remarks	74

7	The pinhole camera	75
7.1	Central projection	75
7.1.1	Camera obscura	76
7.2	Camera centered coordinate systems	77
7.2.1	The normalized camera	81
7.3	The general pinhole camera	83
7.3.1	Camera transformations	84
7.3.2	The camera at infinity	85
7.3.3	Internal and external camera parameters	86
7.3.4	Camera resectioning	88
7.4	The geometry of a pinhole camera	90
7.4.1	Projection lines	90
7.4.2	Equivalent cameras	91
7.4.3	Images of a plane	93
7.4.4	Image of a line	94
7.4.5	Projection planes	95
7.4.6	Geometric interpretation of \mathbf{C}	96
7.4.7	Field of view	96
8	Representations of 3D rotations	99
8.1	Rotation matrices	100
8.1.1	Representations of $SO(3)$	100
8.2	Axis-angle representation	101
8.2.1	Rodrigues' rotation formula	102
8.2.2	Axis-angle from $SO(3)$	103
8.2.3	Summary	104
8.3	$so(3)$	104
8.3.1	Using the matrix exponential function	105
8.3.2	The Cayley transform	106
8.3.3	Summary	107
8.4	Unit quaternions	108
8.4.1	Summary	111
8.5	Three-angle representations	112
8.5.1	Summary	113
8.6	Which representation to choose?	113
8.6.1	Gimbal lock	114
8.7	Twisted rotations	115
9	Epipolar geometry	117
9.1	Stereo cameras	118
9.1.1	Epipolar points	118
9.1.2	Epipolar lines	119
9.1.3	Epipolar planes	120
9.1.4	Epipolar homographies	120
9.2	The fundamental matrix	121
9.2.1	The epipolar constraint	122
9.2.2	The fundamental matrix	123
9.2.3	Symmetry	123
9.2.4	Invariance to homography transformations of 3D space	124
9.2.5	Transformations of the image coordinates	125
9.2.6	Parameterization of \mathbf{F}	125
9.2.7	Camera matrices from \mathbf{F}	126
9.2.8	Summary of properties related to \mathbf{F}	128
9.2.9	The epipolar constraint in practice	128
9.3	Triangulation	129

9.3.1	Ambiguities of the world coordinate system	130
9.4	Stereo rectification	131
9.4.1	Rectified stereo rig	131
9.4.2	Rectification of stereo images	132
9.4.3	The Loop and Zhang rectification method	133
9.5	Calibrated epipolar geometry	133
9.5.1	Normalized stereo cameras	134
9.5.2	The essential matrix	134
9.5.3	Camera poses from \mathbf{E}	136
9.5.4	Transformations of the image coordinates	138
9.5.5	Minimal parameterization of \mathbf{E}	139
9.5.6	Summary of properties related to \mathbf{E}	139

II Estimation 141

10	Introduction to estimation	143
10.1	Least squares formulation	143
10.2	Total least squares formulation	146
10.3	Geometric errors	148
10.4	Algebraic errors	149
10.4.1	The inhomogeneous method	151
10.4.2	The homogeneous method	152
10.5	What causes the errors? (Part I)	153
10.5.1	Model errors	153
10.5.2	Data errors	155
10.6	Maximum likelihood estimation	157
11	Estimation of transformations	161
11.1	Homography estimation	161
11.1.1	Geometric errors	161
11.1.2	Direct Linear Transformation (DLT)	162
11.1.3	The correspondence problem	164
11.1.4	Minimal case estimation	166
11.1.5	Degeneracies	167
11.2	The homogeneous method revisited	168
11.2.1	SVD profile	168
11.2.2	Data normalization	170
11.2.3	SVD profile, again	177
11.2.4	Closing remarks	179
11.3	Camera matrix estimation	180
12	Non-linear estimation	183
12.1	Non-linear estimation techniques	183
12.1.1	Initial solutions	184
12.1.2	Parameterizations	184
12.2	Re-parameterization	187
12.2.1	An example	188
12.3	The residual	189
12.3.1	Re-mapping of the residual	189
12.3.2	Choosing residual	190
12.4	An example: estimation of a line	192
12.4.1	Using a homogeneous representation as parameters	193
12.4.2	Minimal parameterizations	194
12.5	An example: estimation of a homography	196

13 Estimation involving rotations	199
13.1 Estimation of 3D rotations	200
13.1.1 Using OPP	200
13.1.2 Using SOPP	201
13.1.3 Using quaternions	201
13.1.4 OK, so which algorithm do I choose?	202
13.2 Estimation of rigid transformations	203
13.2.1 Iterative Closest Point (ICP)	204
13.3 Non-linear least squares estimation involving rotations	205
13.3.1 Quaternions	206
13.3.2 Axis-angle representation	207
13.3.3 Euler angles	209
13.4 The Perspective n -Point Problem (PnP)	209
13.4.1 Algebraic estimation	210
13.4.2 Geometric minimization	211
13.4.3 Minimal case estimation ($P3P$)	212
14 Estimation of epipolar geometry	213
14.1 Triangulation	213
14.1.1 The mid-point method	213
14.1.2 Algebraic methods	215
14.1.3 Optimal triangulation	215
14.1.4 Closing remarks	218
14.2 Estimation of \mathbf{F}	220
14.2.1 The 8-point algorithm	220
14.2.2 The 7-point algorithm	223
14.2.3 Degeneracies	223
14.2.4 Minimization of geometric errors	225
14.3 Estimation of \mathbf{E}	226
14.3.1 Algebraic estimation	227
14.3.2 Minimal case estimation of \mathbf{E}	228
15 Robust estimation	229
15.1 What causes the errors? (Part II)	230
15.1.1 Inliers and outliers	230
15.2 Robust errors	231
15.3 RANSAC	232
15.3.1 An indeterministic approach	233
15.3.2 Robust estimation of a 2D line	234
15.3.3 Probabilities and number of trials	236
15.3.4 Variants of the basic RANSAC algorithm	236
15.4 Revisiting the correspondence problem	237
15.4.1 RANSAC and the correspondence problem	237
15.4.2 Preprocessing of data	239
15.4.3 Closing remarks	239
15.5 Robust estimation in practice	240
15.5.1 Robust estimation of \mathbf{F}	240
15.5.2 Robust estimation of \mathbf{E}	242
15.5.3 Robustly solving PnP	242

III Applications 245

16 Camera calibration 247

16.1 Automatic camera calibration	248
16.1.1 Mathematical foundation	248
16.1.2 Geometric errors	250
16.2 Lens distortion	250
16.2.1 Radial lens distortion	252
16.2.2 General distortion models	255
16.2.3 General coordinate systems	255
16.2.4 OK, so which distortion model do I choose?	256
16.2.5 Calibration of lens distortion	256
16.2.6 Compensating for the lens distortion	257
16.3 Zhang's calibration method	258
16.3.1 Geometric errors	260
16.3.2 Lens distortion	261
16.3.3 Summary	261

17 Structure from motion 263

17.1 Reconstruction from normalized cameras	265
17.1.1 Accumulative reconstruction from triplets of normalized cameras	265
17.2 Bundle adjustment	267
17.3 Incremental bundle adjustment	268
17.3.1 Initialization	268
17.3.2 Adding a camera	269
17.4 Practical issues	273
17.4.1 Parameterization of the camera poses	273
17.4.2 Flexible scheme for adding cameras	273
17.4.3 Sparsity of \mathbf{J}	274
17.4.4 The Schur complement trick	275

IV Toolbox 277

A Spaces 279

A.1 \mathbb{C}^n as a vector space	279
A.1.1 Scalar product and norm	279
A.1.2 Orthogonality	280
A.1.3 Linear transformations and matrices	280
A.1.4 Common types of complex matrices	281
A.1.5 Frobenius scalar product and norm	282
A.2 Projective spaces	282
A.2.1 Construction of a projective space	282
A.2.2 Operations on projective spaces	283
A.2.3 Concluding remarks	284
A.3 Quaternions	285

B Matrices 289

B.1 Cross product operator	289
B.2 Block matrices	291
B.2.1 Block matrix multiplication	291
B.2.2 Block diagonal matrix	292
B.2.3 Inverse of a block diagonal matrix	292
B.2.4 Blockwise matrix inverse	292
B.3 Singular value decomposition (SVD)	292

B.3.1	Theorem	293
B.3.2	Relation between EVD and SVD	294
B.3.3	Outline of existence proof	294
B.3.4	Applications of SVD	294
B.3.5	Computation of SVD	297
B.3.6	The orthogonal Procrustes problem	298
B.3.7	Special SVD (SSVD)	298
B.4	Perturbation analysis	299
B.4.1	The Eckart-Young theorem	299
B.4.2	Perturbation of the eigensystem of a symmetric matrix	300
B.5	Functions on matrices	301
B.5.1	Matrix power	301
B.5.2	Matrix exponential function	302
B.5.3	Matrix logarithm	303
B.6	Generalizations of the spectral theorem	303
B.6.1	To $so(n)$	303
B.6.2	To $so(3)$	305
B.6.3	To $SO(n)$	305
B.6.4	To $SO(3)$	306
B.7	QR-factorization	307
B.7.1	Special QR-factorization	307
B.7.2	QR-factorization of $3 \times n$ matrices	307
C	Non-linear optimization	309
C.1	General methods	310
C.1.1	Steepest descent	310
C.1.2	Newton's method	312
C.2	Non-linear least squares problems	312
C.2.1	The Gauss-Newton method	313
C.2.2	The Levenberg-Marquardt method	314
C.2.3	Without the Hessian approximation	315
C.3	Stop criteria	316
C.4	OK, so which method do I choose?	316
C.5	Practical issues	317
C.5.1	Computing the Jacobian	317
C.5.2	Sparse Jacobian	318
C.5.3	Inverting $\mathbf{J}^T \mathbf{J}$	318
Index		323
